

# **College of American Pathologists (CAP) GH5 Survey Data:**

**(updated 5/22)**

The American Diabetes Association (ADA) recommends that “The A1C test should be performed using a method that is certified by the NGSP”. All laboratories performing HbA1c testing should participate in a fresh sample proficiency testing survey such as the College of American Pathologists (CAP). CAP GH5 data for the first survey of 2022 are summarized below. The NGSP target or reference values are based on replicate analyses using eight NGSP certified secondary reference methods.

## **Commentary by R. Little, Ph.D., NGSP Network Coordinator for the NGSP Steering Committee**

Beginning in 2015 there are two CAP programs for HbA1c proficiency testing using fresh whole blood samples - GH2 and GH5. GH2 samples are shipped twice a year with three samples in each mailing as before. GH5 are shipped three times a year with five samples in each mailing. The three samples in each of the two GH2 mailings are also included in two of the GH5 mailings. Therefore, the NGSP follows the three GH5 surveys, which include all the samples used for both surveys.

### **In 2022, based on data from the GH5-A survey:**

- Bias from the NGSP target and variability ( $\pm 2SD$ ) are shown in Table 1 and in figure 1 (Figure 1 graphs in order by HbA1c level) for each method. The shaded rectangle (fig 1) reflects the current CAP acceptance limit of  $\pm 6$ .
- Bias:
  - The absolute mean bias for each method group ranged from 0.01 to 0.32% HbA1c.
  - Only two methods had an absolute mean bias of  $>0.30\%$  HbA1c for one sample each; the Alere Afinion AS100 and the Bio-Rad D-10.
- Variability (CV)
  - Method-specific, between-laboratory CVs ranged from 0.9% to 3.5%.
  - There were no methods with CVs over 3.5%. However, six methods, the Alere Afinion 2, all 3 Beckman methods, the Roche cobas c311 and the Ortho Vitros 5,1 FS had CVs over 3.0% for one or more samples.
  - There were 11 methods with CVs  $\leq 2\%$  for 5/5 or 3/3 samples— the Abbott Alinity Ci series, Abbott Architect c, Arkay Adams HA-8180 series, Bio-Rad D-100, Roche cobas c513, Sebia Capillarys 2 Flex Piercing, Sebia Capillarys 3 (CAPI 3), Siemens Atellica CH- Enzymatic reagent, Tosoh G8, Tosoh G11 and Trinity Biotech Premier Hb9210. More than 1/3 of participating laboratories are using these methods with CVs  $\leq 2\%$ .
  - 83% of laboratories are using methods with between-lab CVs  $\leq 3\%$  for 5/5 or 3/3 HbA1c levels.
- Pass Rates
  - The current pass limit for the GH5 survey is  $\pm 6\%$ . The overall pass rates in this survey were 97.5%, 98.3%, 96.9%, 98.5% and 98.6% for samples GH-01 – 05. For individual methods, the lowest pass rate was 87.0% and the highest was 100%.
  - As expected, methods with small bias and low CVs will have the highest pass rates and, conversely, methods with large bias and/or high CVs will have the lowest pass rates.
- The overall (all-method, all-lab) CVs for the last 30 surveys are shown in Table 2. Overall CVs for the 5 samples in the current survey ranged from 2.2% to 2.7%; ALL WERE LESS THAN 3%.
- Laboratories should avoid using methods with high CVs and/or consistent large bias.

**NOTE: The NGSP certification evaluates agreement of each method at the manufacturing site using one lot of reagents and calibrators, one instrument, and one application under optimal conditions. CAP precision reflects between-laboratory reproducibility, often with more than one lot of reagents and calibrators, and sometimes with different instruments (e.g. Siemens Advia instruments) and/or different applications (e.g. with or without sample pretreatment). In addition, if changes were made in the method just prior to NGSP certification, it is possible that not all participating laboratories in the field would have made the change at the time of the CAP survey. For these reasons, it is important that laboratories review not only the certification status of HbA1c methods but also their performance in the CAP survey over time (a good indication of field performance) when selecting or evaluating HbA1c assay methods.**

CVs **below** 3.5% are highlighted in pink

CVs **below** 3.0% are highlighted in blue

HbAS samples is indicated in yellow

There is no assigned value for GH13 due to an unusual amount of variability found during value assignment. Interestingly, there was also a higher than usual variability seen in the all method CV%.
